

Please : eat less meat!

Our meat consumption is responsible for half of the global warming.

Quote from world watch 2009:

Livestock are already well-known to contribute to GHG emissions. Livestock's Long Shadow, the widely-cited 2006 report by the United Nations Food and Agriculture Organization (FAO), estimates that 7,516 million metric tons per year of CO₂ equivalents (CO₂e), or 18 percent of annual worldwide GHG emissions, are attributable to cattle, buffalo, sheep, goats, camels, horses, pigs, and poultry. That amount would easily qualify livestock for a hard look indeed in the search for ways to address climate change. But our analysis shows that livestock and their byproducts actually account for at least 32,564 million tons of CO₂e per year, or 51 percent of annual worldwide GHG emissions.
